                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              LOCUS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ò
                                      bin/displaydb=wormace&class_Sequence &object=C14B4
Current sequence finishing criteria for the C. elegans genome sequencing consortium are that all bases are either sequenced unambiguously on both strands, or on a single strand with both a dye primer and dye terminator reaction, from distinct subclones. Exceptions are indicated by an explicit note.

In PORTANT: This sequence is NOT necessarily the entire insert of the specified clone. It may be shorter because we only sequence overlapping sections once, or longer because we arrange for a small overlapping sections once, or longer because we arrange for a small overlapping sections once, or longer because we arrange for a small overlapping sections once, or longer because we arrange for a small overlapping sections once, or longer because we arrange for a small overlapping sections once, or longer because (1. 101) overlaps with the end of clone F42EB is at 18123 in this sequence 283242.

The end of this sequence (41942. .42042) overlaps with the start of sequence 283242.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        RSRHÖTYNNDCDRTLVILAQRTLAYSTVVTGRLHHSTCPTMKFFWFLLQLTISAFILS

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             source
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     FEATURES
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          SEQUENCING READ COVERAGE:Sequencing is completed to a minimum standard of double strand coverage with a minimum of 2 clones and 2 reads with no ambiguities or 2 chemistries with a minimum of 2 clones and 3 reads with no ambiguities. If the sequence quality for a region does not meet this standard, it will be indicated in the annotation as Low Coverage.
                                                                                                                                                                                                                                                                                                                                                                                       CLONE LENGTH: This sequence does not necessarily represent the entire insert of this clone. Overlapping regions of clones are only sequenced and submitted once, so the sequence for the remainder of the insert may be found in the record for the adjacent clones. Overlapping clones are noted at the beginning and end of the Features listing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    QUALITY OF INDIVIDUAL BASES:This sequence meets stringent quality standards - estimated error rate less than 1 per 10,000 bases. Peports of lowest quality individual bases and measures of base quality are listed below. Description of the metrics can be found at URL: http://gc.bcm.tmc.edu:8088/quality.info/genbank.annotation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    STSs are identified using ePCR (Genome Res. 7:541-550) searches of a local database that includes entries from dbSTS, GDB, and local mapping efforts.

Repeats are identified using RepeatMasker (A. Smit and P. Green,
                                                                                                                                                                                                                              Submitted (29-MAY-1999) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA On May 28, 1999 this sequence version replaced gi:4809319.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                unpublished.) for Human and Mouse sequences.
Genes and Region of sequence similarity are identified by BLAST
(Nuc. Acids Res. 25:389-3402) similarity (expect < 1e-34) to the
EST and cDNA sequences. Genes demonstrate at least two exons
flanked by consensus splice sites that maintained sequence
continuity across the splice junctions. Sequences that are not
identical matches are annotated as similar.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ggaaactgca(a)ccttaagcga

                                                                                                                                                                                                Direct Submission Submitted (17-SEP-1998) Human Genome Sequencing Center, Department Submitted (17-SEP-1998) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA On Jul 31, 1998 this sequence version replaced gi:2909690. Sequencing is completed to a minimum standard of double strand coverage with a minimum of 2 clones and 2 reads with no ambiguities or 2 chemistries with a minimum of 2 clones and 3 reads with no ambiguities. If the sequence quality does not meet this standard, it will be indicated in the annotation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Exon/Intron boundaries of identified genes were chosen if there were canonical splice junctions that maintained sequence continuity across the splice junctions.

Submitted (16-ARR-1999) Genome Sequencing Center, Washington University School of Medicine, 4444 Forest Park Parkway, St. Louis, MO 63108, USA

On Jun 5, 1999 this sequence version replaced gi:4586090.

* NOTE: This is a "working draft' sequence. It currently consists of 4 contigs. The true order of the pieces.

* is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as trus of N. but the exact sizes of the gaps are unknown.

* This record will be updated with the finished sequence as soon as it is available and the accession number will
n 17954. .18213

A comparison of the small ribosomal RNA genes from the
mitochondrial DNA of the great apes and humans: sequence,
structure, evolution, and phylogenetic implications
Mol. Biol. Evol. 3 (1), 1-18 (1986)
                                                                                                                                                                                                                                                                                                                                                                       Foran, D.R., Hixson, J.E. and Brown, W.M. Comparisons of ape and human sequences that regulate mitochondrial DNA transcription and D-loop DNA synthesis Nucleic Acids Res. 16 (13), 5841-5861 (1988)

                                                         Symptoms occur.

Claim 2; Page 33: 41pp; English.

Claim 2; Page 33: 41pp; English.

Interleukin-1-beta (IL-1-beta) primers 2 and 1 (V32391) were used to amplify the IL-1-beta gene region to identify single base variation polymorphism of c/T at base 51.

The invention claims to provide a method involves isolating DNA from a patient and determining the DNA polymorphism pattern of the genes that code for interleukin-1-alpha, interleukin-1-beta and interleukin-1RN. The polymorphism pattern compared with controls of known DNA polymorphism patterns thereby identifying patients carrying a genetic polymorphism patterns thereby identifying patients carrying a genetic polymorphism associated with increased risk of sight threatening diabetic retinopathy. The method may be able to identify diabetic patients at risk before the clinically detectable disorders occur. Polymorphism pattern clinically detectable disorders occur. Polymorphism pattern in genome involved PCR reactions using primers v32389-v32389. The method is also claimed to be useful in conjunction with identification of other genes associated with sight threatening diabetic retinopathy in genomic DNA and therefore, in identifying diabetic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Claim 6; Page 15; 22pp; English.

PCR primers V6032-33 were used to amplify alleles associated with interleukin-lb (IL-1B). The specification describes a method for determination of a patient's predisposition to coronary artery disease. The method comprises comparing an allele with a second allele which is predictive of coronary artery disease, where similarity between the first and second alleles indicates a predisposition to coronary artery disease. The method is used to genotype an individual's interleukin (IL)-ll loci, the method is used to screen a patients' predisposition to coronary artery disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Detection of predisposition to coronary artery disease - by comparative measurement of levels of expression of alleles from the interleukin 1 locus
 Predicting increased risk of sight-threatening diabetic retinopathy
                comprises identifying genetic polymorphism pattern for genes ,-1A, IL-1B and IL-1RN, useful to allow treatment before clinical

Prov method of determining a patient's susceptibility to inflammatory of sorders - by detecting the presence of an IL-1 (4411232)

Proporders - by detecting the presence of an IL-1 (4411232)

Proporders - by detecting the presence of an IL-1 (4411232)

Proporders - by detecting the presence of an IL-1 gene cluster

Claim 3: Page 33: 49pp; Engdish.

Comparison of an inflammatory disorder. The method comprises the detection of an interleukh 1 (IL-1) (4411232) haplotype in a sample obtained from the interleukh 1 (IL-1) (4411232) haplotype. The method provides kits for disorder. X16607 to X16631 represent PCR primer used in the method for detecting the IL-1 (44112332) haplotype. The method provides kits for detecting the IL-1 (44112332) haplotype. The method provides kits for detecting the IL-1 (44112332) haplotype. The method provides kits for detecting the IL-1 (44112332) haplotype. The method provides kits for detecting the IL-1 (44112332) haplotype. The method provides kits for detecting the IL-1 (44112332) haplotype. The method provides kits for detecting the IL-1 (44112332) haplotype. The method provides kits for disorders, including coronary artery disease, osteoporosis, nephropathy in diabetes mellitus, alopecia areata, Graves disease, systemic lupus CC envythamatosy ilchem sclerosis and ulcerative colitis. The detection of allowed in fusual dependent diabetes. The identification of a portian disease, and insulficient disease, sociated haplotype enables determination of which alleles from the IL-1 gene cluster are associated with particular CC some alleles from the IL-1 gene cluster are associated with particular CC inflammatory diseases, and insufficient IL-1 production appears to act centrally in the pathology of these diseases. Therefore, the use of IL-1 gene clusters is useful in determining genetic susceptibility to component.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   X22303;

                                                                                                                                                                                                                                       WPI: 99-153692/13.

New isolated nucleic acid encoding the new human cytokine Tango-77 - used to inhibit inflammation and to screen for specific modulators
Frample 5: Figure 4: 226pp: English.

X02956-X03048 and X22301-X22304 are overlapping BAC genomic sequences
Containing alternatively spliced forms of human IL-1ra. Such fragments
are used in the method of the invention which describes the isolation of
a novel human TANGO-77 encoding nucleic acid and protein. Tango-77 is a
conflammation by binding to the interleukin-1 receptor (IL-1R). It may
also bind to a new receptor so could regulate other cellular processes
associated with acute or chronic inflammation, e.g. asthma, chronic
conflammations associated with advaged arthritis, psociasis and inflammatory
Coowel disease. It may also induce or suppress interleukins, cytokines and
growth factors. Modulators of this protein are used to treat or prevent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New isolated nucleic acid encoding the new human cytokine Tango-77 - used to inhibit inflammation and to screen for specific modulators used to inhibit inflammation and to screen for specific modulators X02956-X03048 and X22301-X22304 are overlapping BAC genomic sequences containing alternatively spliced forms of human IL-1ra. Such fragments are used in the method of the invention which describes the isolation of a novel human TANGO-77 encoding nucleic acid and protein. Tango-77 is a member of the cytokine superfamily that is expected to inhibit inflammation by binding to the interleukin-1 receptor (IL-1R). It may also bind to a new receptor so could regulate other cellular processes associated with acute or chronic inflammation, e.g. asthma, chronic harman also because it may also as the meaning at the manific processes associated with acute or chronic inflammation, e.g. asthma, chronic harman accordance in architist, psociasis and inflammatory when a new receptor architist, psociasis and inflammatory when a new recent and a manific mani

PP Transform plants to provide resistance gene - used to PT transform plants to provide resistance to pathogens or pests, PT Transform plants is majors in approximately 9.9 kb sequence located CC around the wild tomato, Lycopersion peruvianum (PI 128657), AFLP CC marker PM14, which comprises the root knot nematode Meloidogyne CC incognita (Mi) resistance gene. The gene can be used to transform CC incognita (Mi) resistance to plant pathogens or pests, particularly nematodes, e.g. root-knot nematodes, or aphids.

CC particularly nematodes, e.g. root-knot nematodes, or aphids.

CC particularly nematodes, e.g. root-knot nematodes, or aphids.
conditions associated with abnormal levels of inflammation, or activity of IL-1 or its receptor complex.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Transgenic plants
Claim 1: Fig 5A-D: 48pp; English.
Claim 1: Fig 5A-D: 48pp; English.
This nucleotide sequence comprises the tomato Mi resistance gene
This nucleotide sequence comprises the tomato Mi resistance gene was cloned
che confers resistance against nematodes. It codes for a 1207
amino acid protein (see W27080). The Mi resistance gene was cloned
from a tomato genotype that is resistant to Meloidogyne incognita
check in a markers linked to the Mi resistance gene was cloned
confecular markers linked to the Mi resistance gene; construction of
a high mol.wt. yeast artificial chromosome (YAC) library; physical
mapping of the molecular markers on the YAC clones and YAC contig
configuration of a cosmid library of the YAC clones
harbouring the linked molecular markers; physical fine mapping and
cosmid contig building; genetic characterisation of tomato mutants
cosmid contig building; genetic characterisation of susceptible
plants with the cosmids forming the contig; and complementation
analysis. The invention further relates to genetically transformed
incognital, and to probes and primers useful for identification of
resistance.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     07-JUN-1999 (first entry)

Tomato pest resistance Mi gene (copy 1).

Pest resistance; nematode resistance; disease resistance; Mi gene; tomato; transgenic plant; crop protection; biological control; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            10071. .14691

This is the nucleotide sequence of the tomato Mi locus associated with 1st 1st the nucleotide sequence of the tomatom in this is the nucleotide sequence of the tomatom artificial chomosome (ABC). Mi was localised by genetic analysis to a region of the tomato genome of about 65 kb. DNA corresponding to this sequence analysis of a 52 kb abC3 insert identified 3 open reading frames, one of which is probably a pseudogene. By RNA blot analysis, transcripts of a 52 kb approximately 4 kb corresponding to copy 1 and copy 2 were found in both resistant but not susceptible chamtor cots and in leaves of resistant but not susceptible plants. CDNA sequences corresponding to full-length transcripts of copy 1 (see. V26082) and copy 2 (see V26083) were obtained. The encoded polypeptides (see W55974-75) are 91% identical and contain structural features similar to known leucine-rich repeat (MSS/LRR) family. A recombinant expression cassette comprising an Mi polynucleotide and an operably linked especially tomatoes (claimed). Transgenic plants can also be especially tomatoes (claimed). Transgenic plants can also be constructed usi. 3 a Mi promoter with heterologous genes; the Mi temporal and spatial patterns and at similar levels to resistance temporal canners.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                              resistance - useful to produce transgenic plants resistant to these and other pests, and in marker-aided selection to assess cultivars for resistance
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        30-37N-1992 (lirst entry)
Plasmid pTM72 insert encoding a human cAMP phosphodiesterase.
Cyclic nucleotide; PDE; glioblastoma cell; rollpram-sensitive; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Complementary screening for genes and prods. - e.g. RAS protein and CAMP, that modify, complement or suppress genetic defect and correct associated phenotypic alteration claim 15; Page 91; 165pp; English.
Plasmid pTM72 contains a human glioblastoma cDNA which encodes a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        .;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human low KM, cAMP-specific phospho-di:esterase and nucleic acids encoding it - used to identify binding cpds. useful as encoding it - used to identify binding cpds. useful as therapeutic agents and as probes to evaluate disease states. Claim 3: Page 29-32; 54pp: English.

The cDNA encodes human low Km, cAMP-specific phosphodiesterase, PDE IV(B). The enzyme and fusion proteins can be used to identify ligands and drugs binding to it. These compounds are useful antidepressant, antiasthmatic and antinflammatory agents. Sequence 3890 BP: 1127 A; 846 C; 852 G; 1065 T;
rolipram-sensitive cAMP PDE. The sequence is very closely related to, but distinct from, the rat pRATDPD cDNA insert (see Q1654).

N.B. This sequence is SEQ ID NO. 22 in the specification but is referred to as SEQ ID NO. 23 in the text, 'e.g. on page 32. Sequence 3186 BP; 927 A; 743 C; 734 G; 782 T;

PT PROBLEM WORDS.

PT AMA MOIS. isolated from human glioblastoma cells - encode

RAS-related or cyclic nucleotide phosphodiesterase proteins

Claim 4: Column 81:88; 101pp; English.

The sequences given in 734374-76 represent plasmid fragments which

CC contain human glioblastoma cell cDNA inserts which are capable of

Correcting the heat shock sensitivity of the phosphodiesterase

CC deficient yeast strain 10DAB. Several cDNA's were isolated and

Sequenced. PTM22 encodes a novel human gene. From computer analysis,

Phosphodiesterase and the rat DPD phosphodiesterase. Sequences related

CC pTM22 were found to be expressed in human heart. Plasmid pTM22 was

CC pTM22 were found to be expressed in human heart. Plasmid pTM22 was

CC to pTM22 were found to be expressed in human heart. Plasmid pTM22 was

CC to pTM22 were found to be expressed in human heart. Plasmid pTM22 was

CC to pTM32 were found to be expressed in human and the pTM32 was

CC trains. It thus appears that the pdel- and pdel- yeast strain 10DAB

CC servation. It he plasmids pTM3 and pTM72 were also characterised. These

CC two different cAMP phosphodiesterase cDMA's were found to be closely

CC pTM3 and pTM2, pC744x and pRATDPD encode rollpram sensitive cAMP

CC phosphodiesterases.

CC pTM3 and pTM2, pC744x and pRATDPD encode rollpram sensitive cAMP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

Disclosure: Page 64-68; 87pp; English.

In order to increase the soluble solids content of tomato fruit

produced by a tomato plant, a DNA construct contg. DNA encoding an
invertase is introduced. The DNA encoding the invertase is pref.

C operatively linked to a promoter recognised by the plant RNA
popumentally inverted to a promoter recognised by the plant RNA
such as the cauliflower mosaic virus (CaMV) 355 promoter, or a
developmentally regulated promoter that confers fruit specificity
and appropriate temporal control on the expression of the DNA
encoding invertase, e.g. a native Lycopersicon invertase promoter

C or the histidine decarboxylase (HDC) promoter region.

If the DNA encodes an invertase that is not a vacuolar invertase,
DNA encoding invertase is operatively linked to DNA that encodes
c vacuolar targeting sequences, and, if necessary, DNA encoding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

Claim 7; Page 77 + 61-64; B7pp; English.

In order to increase the soluble solids content of tomato fruit produced by a tomato plant, a DNA construct contg. DNA encoding an invertase is introduced. The DNA encoding the invertase is pref. operatively linked to a promoter recognised by the plant RNA operatively linked to a promoter recognised by the plant RNA as the cauliflower mosalc virus (CaNV) 35s promoter, such as the cauliflower mosalc virus (CaNV) 35s promoter, or a developmentally regulated promoter that confers fruit specificity and appropriate temporal control on the expression of the DNA encoding invertase, e.g. a native Lycopersicon invertase promoter. If the DNA encodes an invertase that is not a vacuolar invertase, DNA encoding invertase is operatively linked to DNA that encodes is and invertase is operatively linked to DNA that encodes is and invertase is operatively linked to DNA that encodes is and invertase is operatively linked to DNA that encodes is and invertase is operatively linked to DNA that encodes is and in the DNA encoding invertase is operatively linked to DNA that encodes is and invertase is operatively linked to DNA that encodes is and invertance in the contains invertase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               active site
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

Trit, 2. JULY 1970.

Tomato vacuolar invertase gene - useful for producing transgenic plants with higher soluble solid content in fruit, giving greater commercial value and content in fruit, giving greater Disclosure; Page 71-75; 87pp; English.

Disclosure; Page 71-75; 87pp; English.

In order to increase the soluble solids content of tomato fruit produced by a tomato plant, a DNA construct contg. DNA encoding an invertase is introduced. The DNA encoding the invertase is pref. Copymerase II. The promoter recognised by the plant RNA polymerase II. The promoter recognised by the plant RNA polymerase II. The promoter recognised by the plant RNA colymerase II. The promoter recognised by the plant RNA polymerase II. The promoter recognised by the plant RNA colymerase II. The promoter mast be a constitutive promoter, and appropriate temporal control on the expression of the DNA encoding invertase, e.g. a native Lycopersicon invertase promoter if the DNA encoding invertase, is operatively linked to DNA that encodes invertase, common or control of the cessary, DNA encoding signal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          3770 T;
